16-rank of class groups of quadratic number elds

Abstract: We will discuss how Vinogradov's method applies to the study of the 2-part of class groups in certain thin families of quadratic number—elds. We will show how the method yields density results for the 16-rank in the families of quadratic number—elds parametrized by discriminants of the form—4p and 8p, with p prime. We will also explain certain limitations of the method arising from reliance on short character sum estimates.
